IP Geolocating/Traceroute Script

Most web logs give you basic ip address of your visitor, what country their from, etc. Boring! But if you want to know what town your visitors live in, whether or not they are using a proxy, what their true ip address is, a whois on their proxy and their ip address, a traceroute and a map of where they are...all you do is take our web site remote tracing code and place it in your web site. This is great for making your own "honeypot" to send people to who you want to get info on!
