Webserver Stress Tool

Webserver Stress Tool simulates any number of simultaneous users accessing a webserver. Just select the URLs of your server or web application, choose the number of users, and you are told how long your customers have to wait when visiting your website and how your webserver performs under heavy load. Works with all web servers, with full support for SSL.

Resource Specifications:

Version:	7.1.0.222
Platform(s):	windows
